Darbā apkopotas ziņas par Ogres rajonā 114 dendroloģiskajos stādījumos konstatētajiem 58 vietējo 415 un introducētajiem koku un krūmu taksoniem. Pētījumi veikti no 1973. līdz 2004. gadam. Minētas atrašanās vietas, doti koku izmēri.

**Raksturvārdi:** vietējās sugas, svešzemju sugas, koki un krūmi, Ogres rajons.

### IEVADS

Darbā apkopoti dati par Ogres rajonā 114 objektos konstatētajiem kokiem un krūmiem. Inventarizēti visi zināmie dendroloģiskie stādījumi: pilsētās (Ogrē, Lielvārdē, Ikšķilē, Ķegumā) un laukos – bijušo muižu, pusmuižu un mācītājmāju parki, kā arī atsevišķas privātās kolekcijas. Galvenie pētījumi R. Cinovska vadībā veikti no 1973. gada līdz 1986. gadam. Atsevišķi dendroloģiskie objekti atkārtoti inventarizēti no 1989. līdz 2005. gadam.

Ogres rajonā 114 dendroloģiskajos objektos konstatēti 474 koku un krūmu taksoni (58 savvaļas un 416 introducētie) – sugas, pasugas, varietātes, formas un šķirnes.

Dendroloģiski vērtīgākais objekts Ogres rajonā ir dendroloģiskais parks “Lazdukalns” (tautā biežāk dēvēts par Špakovska dendrāriju), kur 2004. gada inventarizācijā konstatēti 259 vietējo un introducēto koku un krūmu taksoni. Vairākas šajā parkā stādītās koku un krūmu sugas – *Chamaecyparis thyoides*, *Sorbus torminalis*, *Diervilla lonicera*, *Magnolia kobus*, *Aralia mandshurica* u.c. – ir retas ne tikai Ogres rajona stādījumos, bet arī visā Latvijā. Vairāk nekā 50 taksonu konstatēts Lindes parkā un Ozoliņu parkā Ikšķilē, kā arī “Ceplīšos”, tuberkulozes slimnīcas apstādījumos. Stipri pārveidotā Lielvārdes parka lepnums ir vecie Amūras korķkoki (*Phellodendron amurense*). Domā, ka tie šeit varētu būt ieaudzēti ap to pašu laiku (1856.), kad akadēmiķis K. Maksimovičs tūlīt pēc šīs sugas atklāšanas dabā tos iestādīja Sanktpēterburgā.

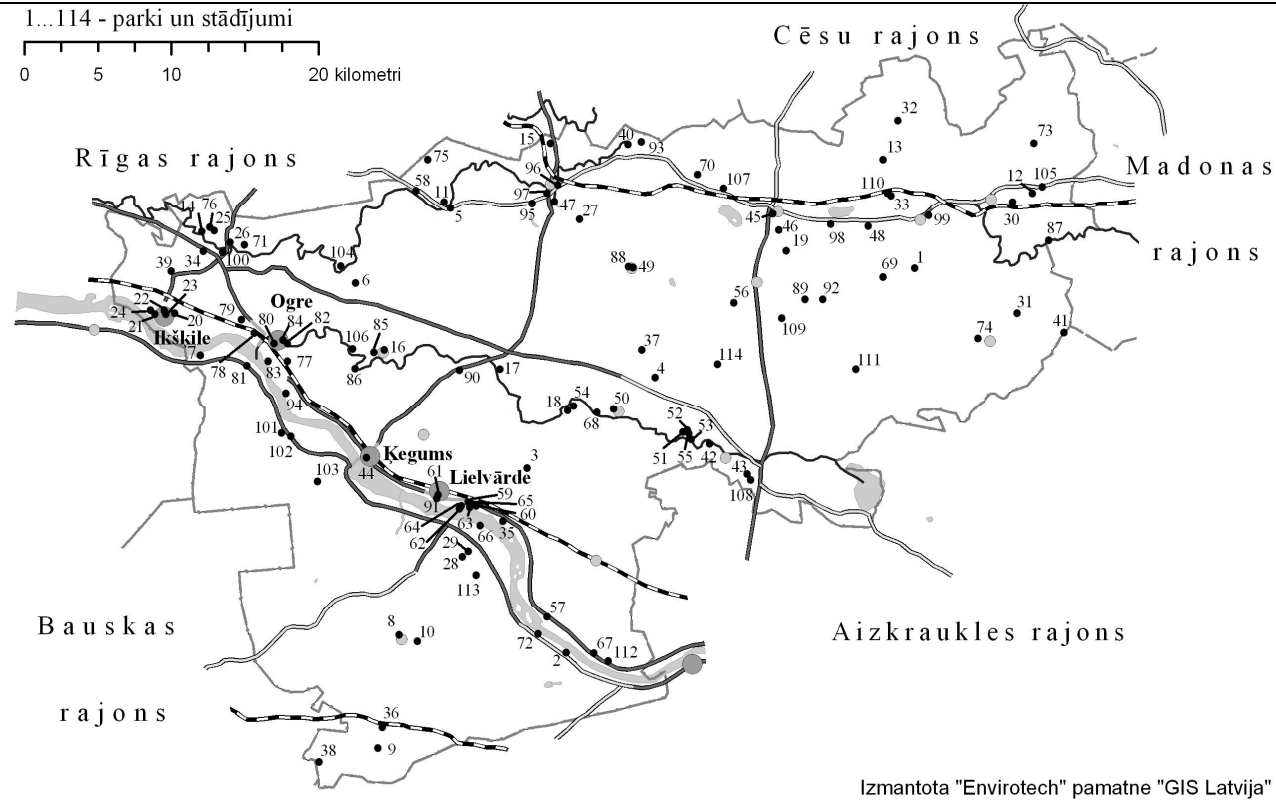

Inventarizācija dendroloģiskajos stādījumos veikta pēc vienotas Raimonda Cinovska izstrādātas metodes (R. Cinovskis u.c. 1986. *Latvijas dendroloģiskās vērtības*. Rīga, “Zinātne”).

Uzskaitīti vietējie un introducētie koku un krūmu taksoni (sugas, pasugas, varietātes, formas, šķirnes). Minētas atradnes, dots koku skaits un daļai koku (introducētās sugas un dižkoki) arī izmēri: koka augstums un stumbra caurmērs (1,3 m augstumā) vai apkārtmērs (ja stumbra caurmērs lielāks par 1m).

Lietoti šādi saīsinājumi (alfabētiskā secībā): a. – aleja; apst. – apstādījumi; atv. – atvases; bij. – bijušais; cv. – šķirne; d – stumbra caurmērs krūšaugstumā (cm);  $d_{0,8}$  – stumbra caurmērs citā (šai gadījumā 0,8 m) augstumā;  $d_{max}$  – resnāka koka stumbra caurmērs (cm) koku grupā; dendr. – dendroloģisks; dzīvž. – dzīvžogs; fragm. – fragments; gr. – koku vai krūmu grupa; h – koka augstums (m); kv. – meža kvartāls; m. - māja; m.m. – mācītājmāja (mācītājmuiža); n – koku skaits, ja koku ir daudz (vairāk par 50), bet precīzs skaits nav zināms; nog. – meža nogabals; p – stumbra apkārtmērs (cm); p. – parks; pag. – pagasts; stād. – stādījumi.

Šajā publikācijā dots rajonā inventarizēto stādījumu alfabētiskais rādītājs (tajā ir ziņas par stādījumu raksturu, vietējo un introducēto taksonu skaitu objektā (izcelti), inventarizācijas datumu) un taksonu saraksts.

Taksonu sarakstā aiz latīniskā nosaukuma ir latviskais nosaukums (sugām, pasugām un dažkārt arī šķirnēm). Pasvītrotie skaitļi ir kārtas numuri stādījumu alfabētiskajā rādītājā. Iekavās dots koku skaits, caurmērs (ja kokam ir vairāki stumbri, caurmērs rakstīts šādi: 12/15/20) un augstums, kā arī dažādas piezīmes. Atšķirībā no iepriekšējām sērijas publikācijām, ir dažas izmaiņas taksonu autoru rakstībā atbilstoši pasaulē pieņemtai rakstībai (“*Authors of Plant Names*”, 1992, Kew).
